# Agenda

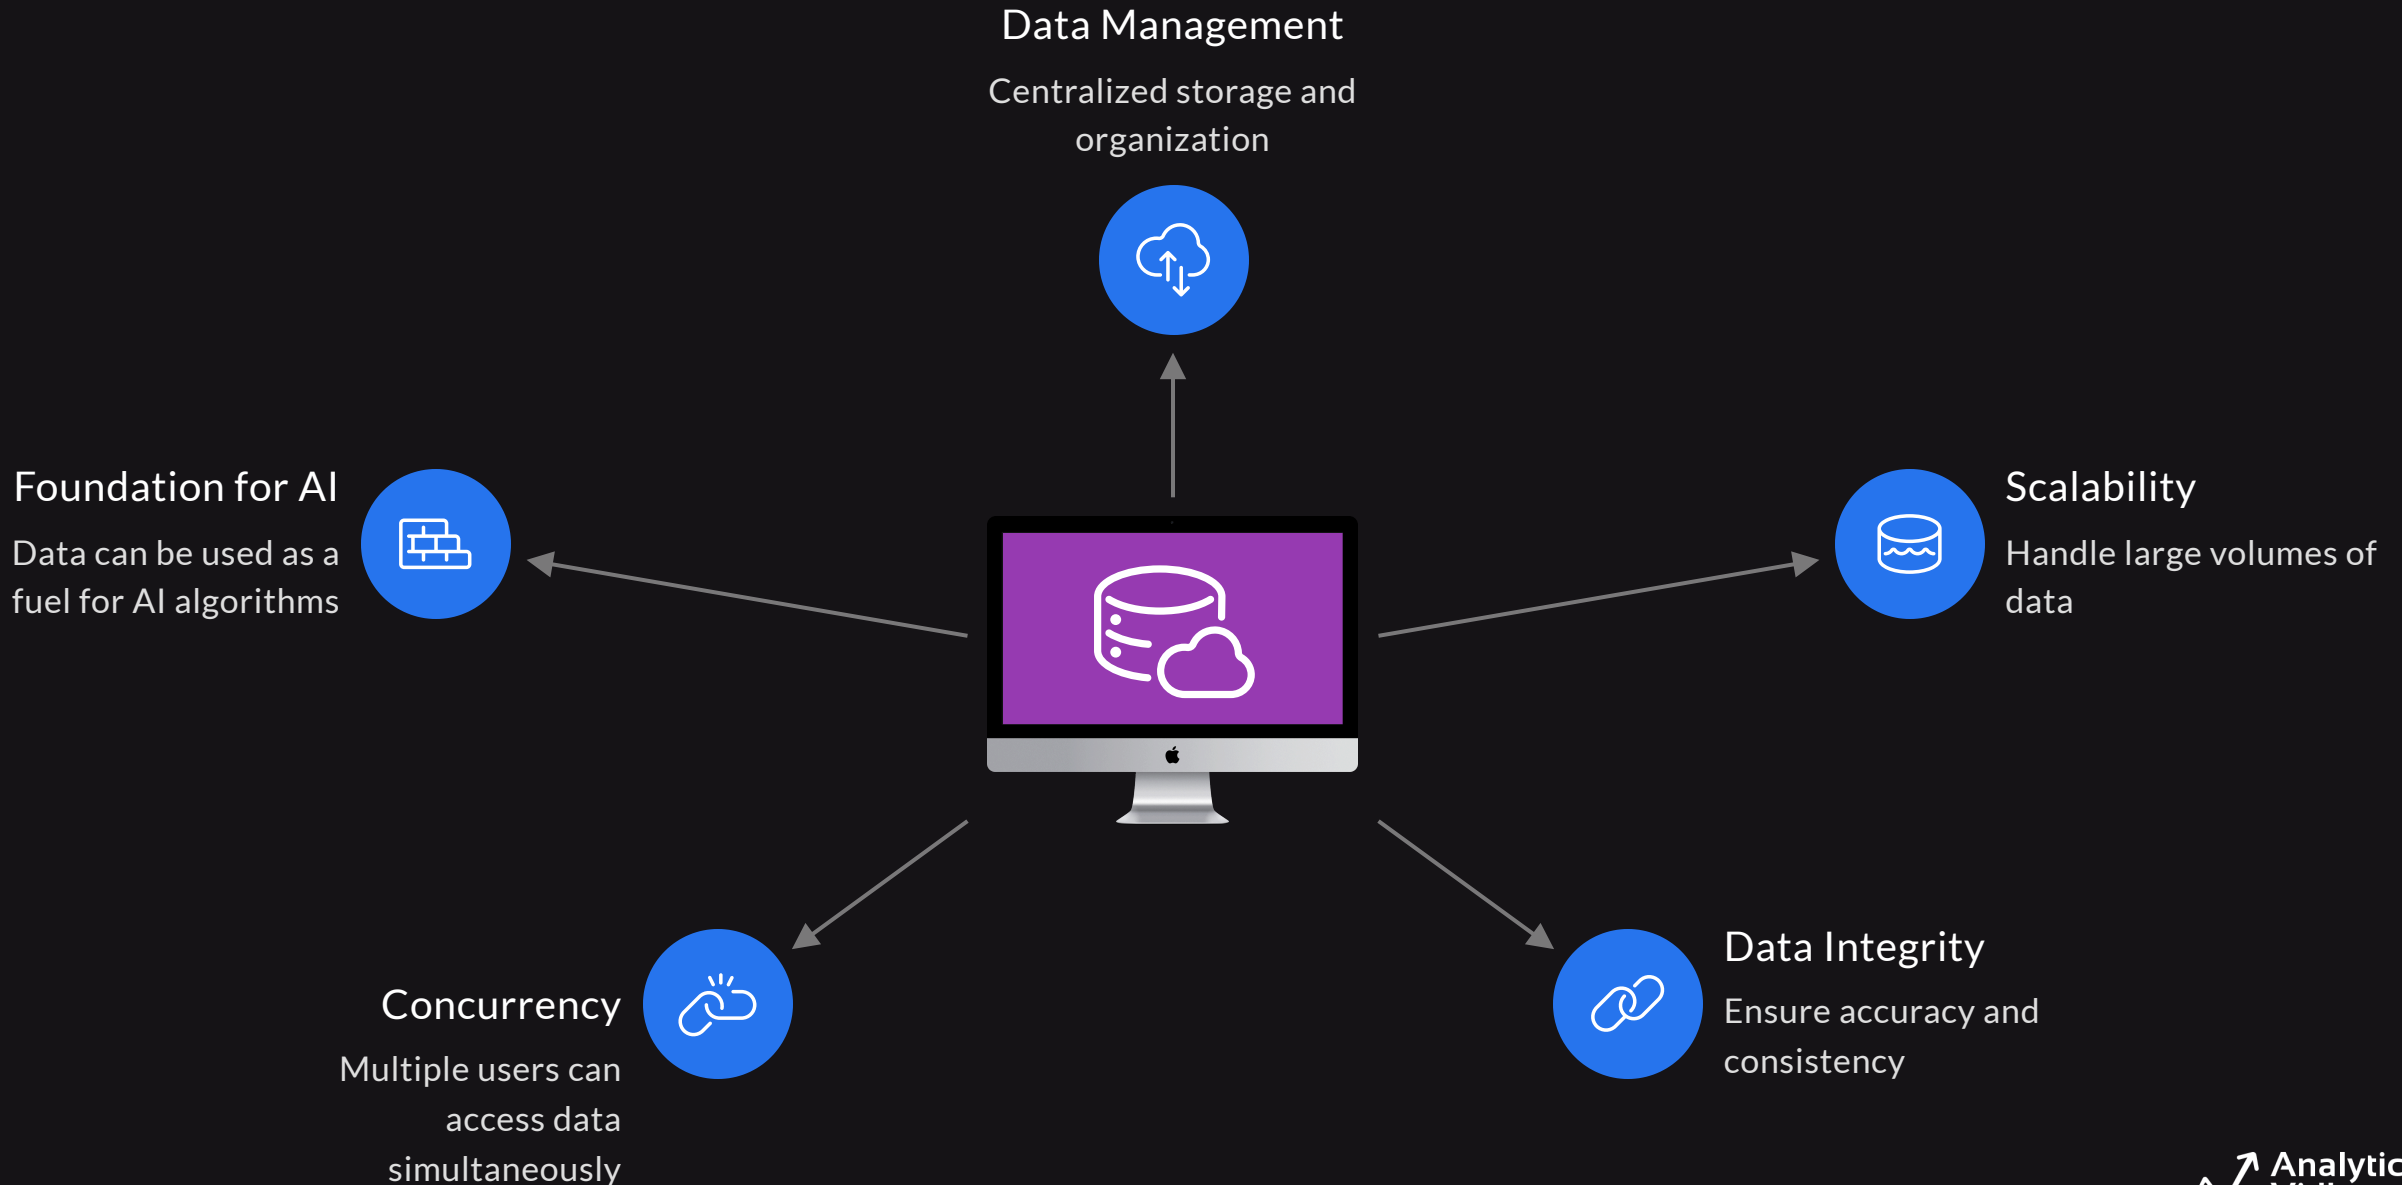

# What is a Database

# Types of Databases

# Why are Databases Important?

# Introduction to SQL

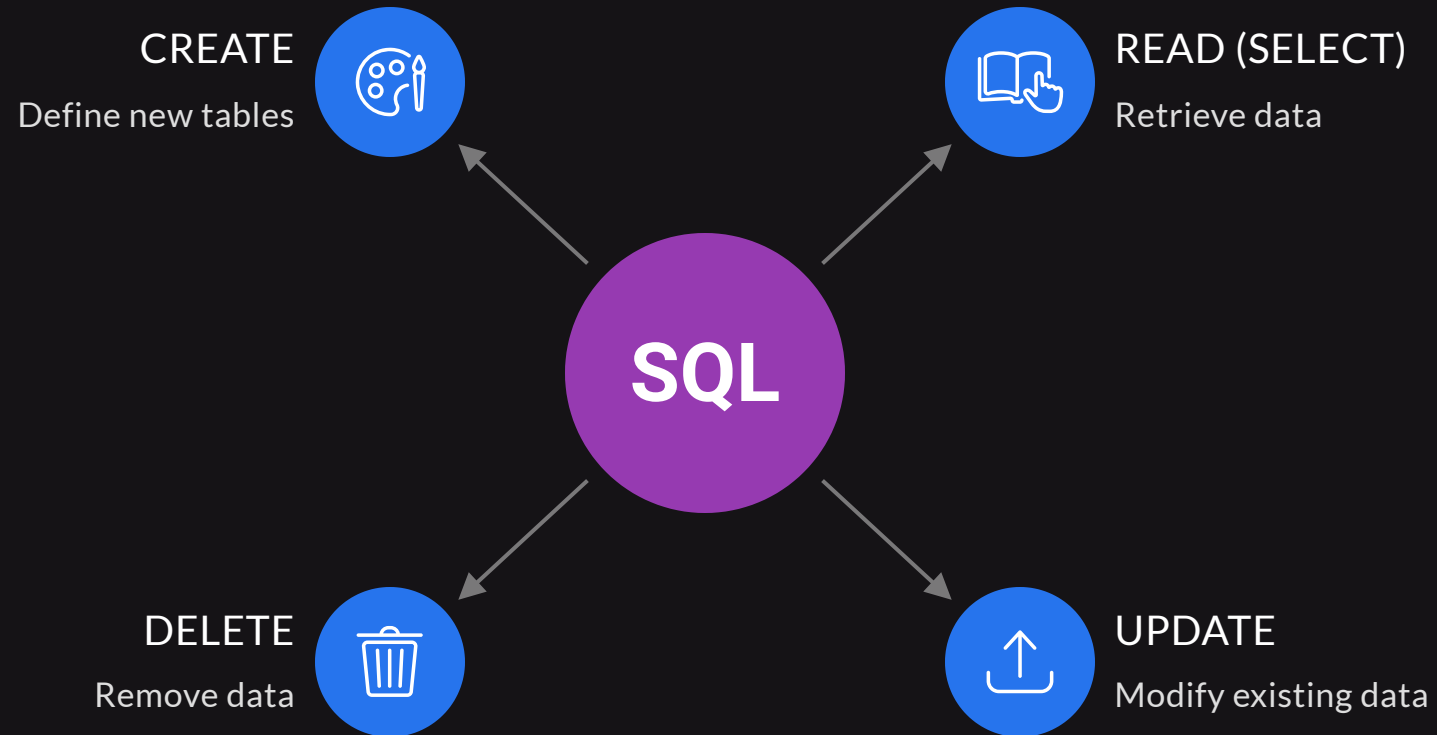

**1** SQL: Structured Query Language

**2** Purpose: Communicate with relational databases

**SQL**

# SQL: Key Operations

# Basic SQL Commands

CREATE TABLE

Define a new table and its columns

INSERT INTO

Add new data to a table

UPDATE

Modify existing data within a table

DELETE

Remove data from a table

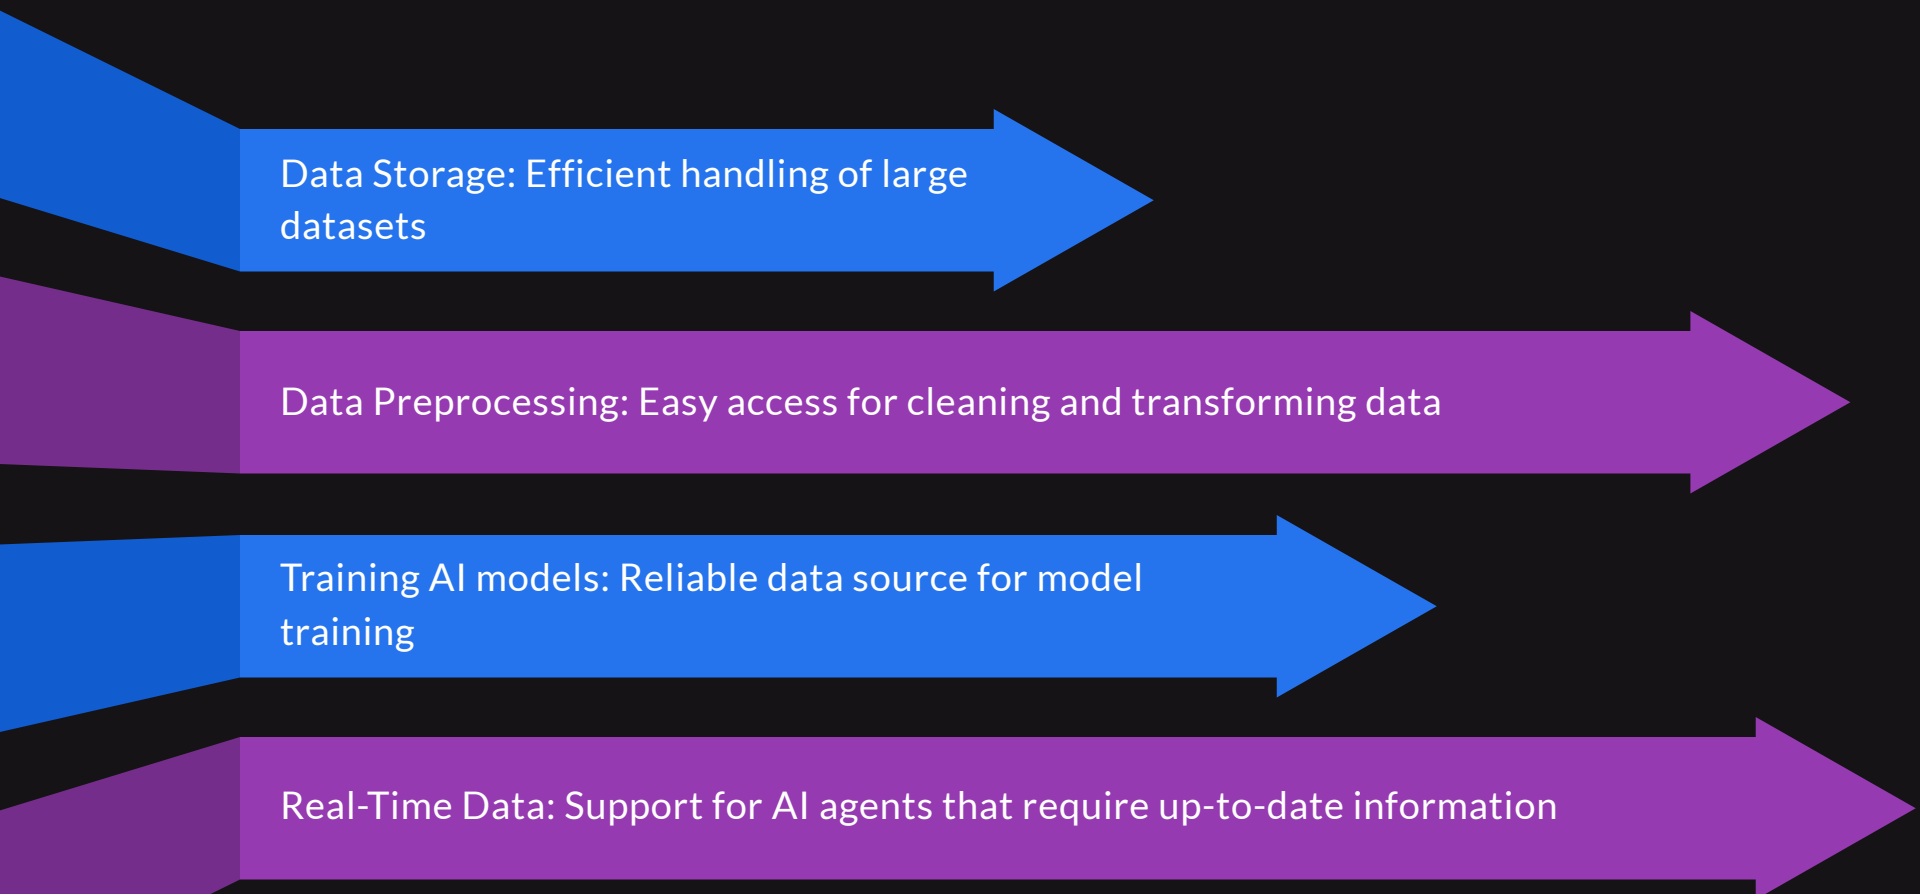

SELECT

Retrieve data from one or more tables

# Importance of Databases in AI

Databases are vitals in the field of AI for several reasons.

Data Storage: Efficient handling of large datasets

Data Preprocessing: Easy access for cleaning and transforming data

Training AI models: Reliable data source for model training

Real-Time Data: Support for AI agents that require up-to-date information

# Connecting Databases to Agents

1

## Data Extraction

Use SQL queries to retrieve data

2

## Integration

Connect databases to programming languages (e.g., Python)

3

## Libraries and Tools

Python's sqlite3, pymysql, psycopg2

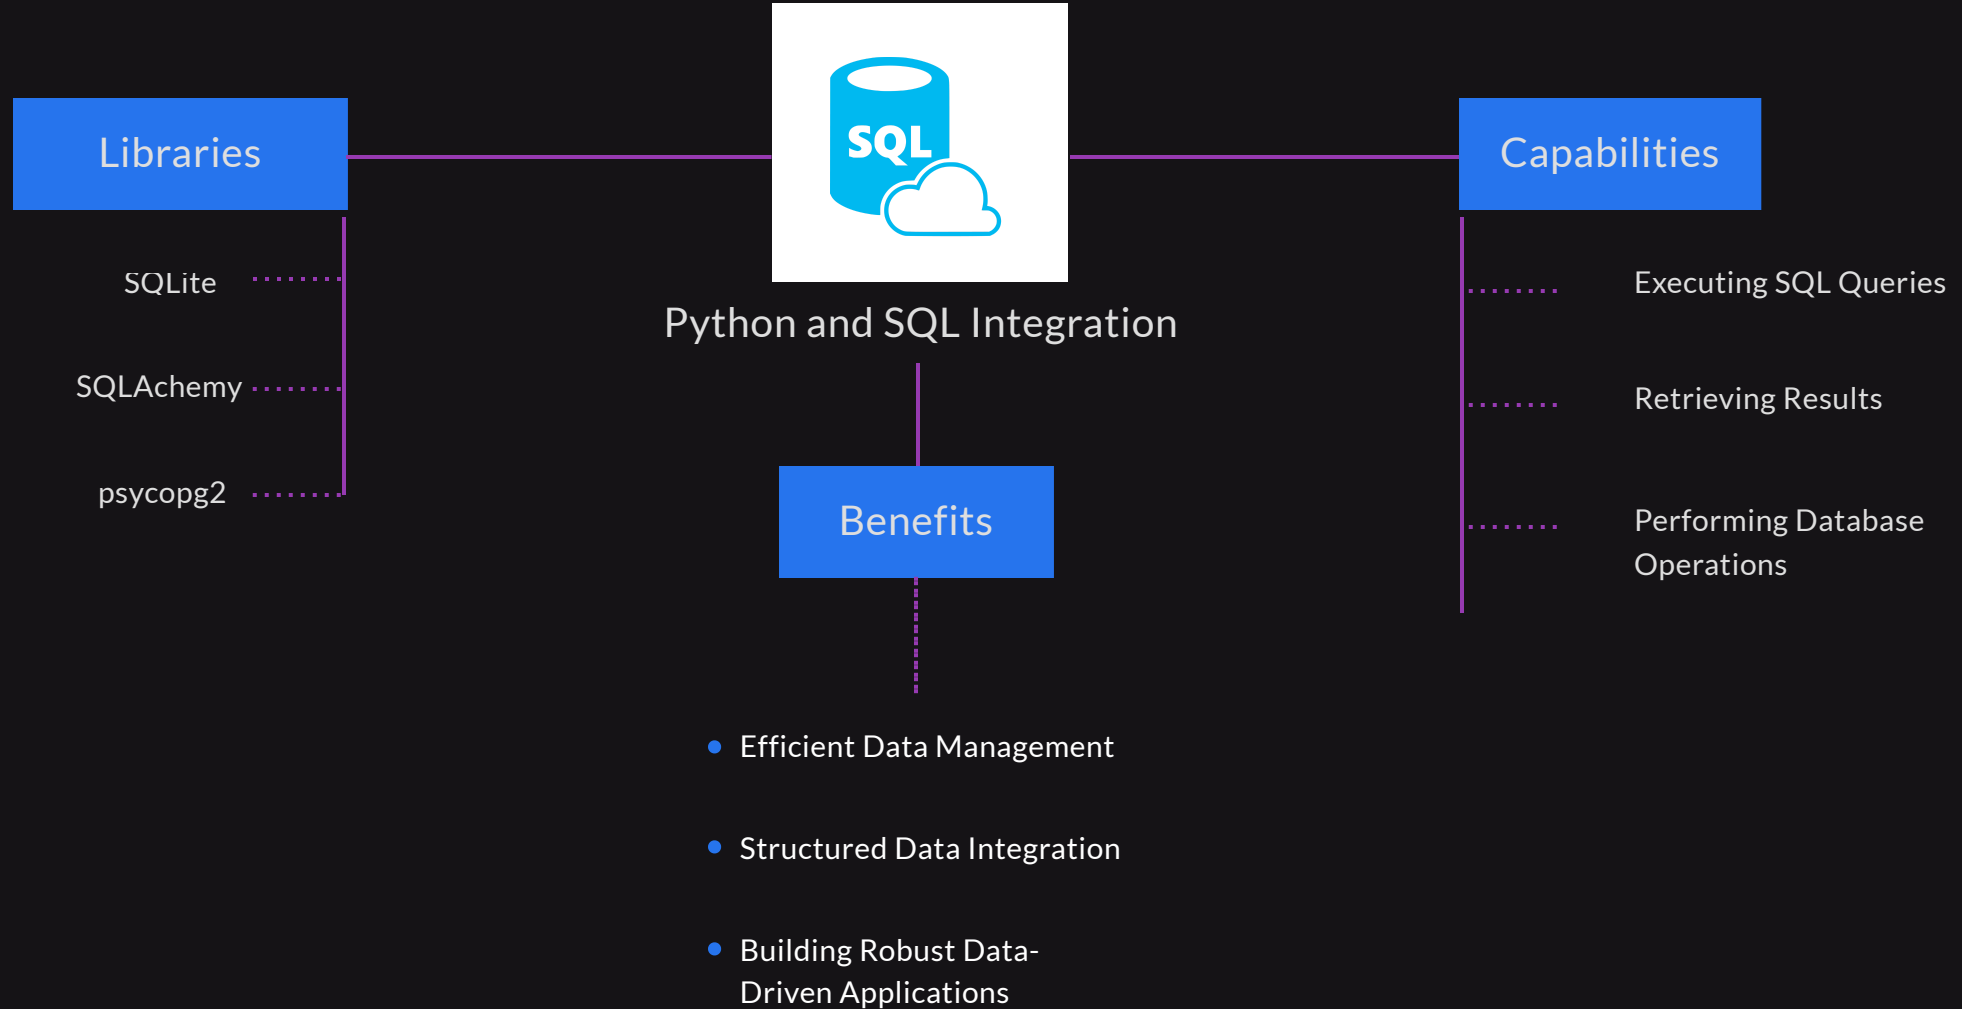

ORM framework like SQLAlchemy

4

## Applications

Feed data into AI algorithms for processing and decision-making
